Discussion and
summary

- Sample space S is nonnegative integers.
- Poisson random variable $X \in S = \{0, 1, 2, \dots\}$
- Poisson probability distribution

$$p_X(k) = \text{Prob}(X = k) = e^{-\lambda} \frac{\lambda^k}{k!}$$

- This probability distribution has one parameter, λ .
- Normalization follows from Maclaurin series for e^λ

$$\sum_{k=0}^{\infty} p_X(k) = \sum_{k=0}^{\infty} e^{-\lambda} \frac{\lambda^k}{k!} = e^{-\lambda} \sum_{k=0}^{\infty} \frac{\lambda^k}{k!} = e^{-\lambda} e^{+\lambda} = 1.$$

Discussion and
summary

■ Poisson probability distribution

$$p_X(k) = \text{Prob}(X = k) = e^{-\lambda} \frac{\lambda^k}{k!}$$

- Every application of $\lambda \frac{d}{d\lambda}$ to λ^k introduces factor of k .
- We have $(\lambda \frac{d}{d\lambda}) \lambda^k = k\lambda^k$, and hence $(\lambda \frac{d}{d\lambda})^m \lambda^k = k^m \lambda^k$.
- Since $\sum_{k=0}^{\infty} \frac{\lambda^k}{k!} = e^{\lambda}$, it follows $\sum_{k=0}^{\infty} k^m \frac{\lambda^k}{k!} = (\lambda \frac{d}{d\lambda})^m e^{\lambda}$
- Multiplying by $e^{-\lambda}$ then yields

$$E(X^m) = \sum_{k=0}^{\infty} k^m p_X(k) = \sum_{k=0}^{\infty} k^m \frac{\lambda^k}{k!} e^{-\lambda} = e^{-\lambda} \left(\lambda \frac{d}{d\lambda} \right)^m e^{\lambda}.$$

- Right-hand side straightforward to calculate.

Maximizing
the likelihood

The estimator
function $\hat{\lambda}$

Discussion and
summary

- Mean (first moment):

$$E(X) = \sum_{k=0}^{\infty} p_X(k)k = e^{-\lambda} \left(\lambda \frac{d}{d\lambda} \right)^1 e^{\lambda} = \lambda$$

- Mean square (second moment):

$$E(X^2) = \sum_{k=0}^{\infty} p_X(k)k^2 = e^{-\lambda} \left(\lambda \frac{d}{d\lambda} \right)^2 e^{\lambda} = \lambda^2 + \lambda$$

- Variance:

$$\text{Var}(X) = E(X^2) - E(X)^2 = (\lambda^2 + \lambda) - (\lambda)^2 = \lambda$$

- Note mean and variance both equal to parameter λ .

The estimator
function $\hat{\lambda}$

Discussion and
summary

- Suppose we are given $n = 50$ Poisson-distributed samples:

3, 4, 3, 5, 3, 4, 5, 0, 5, 5, 5, 4, 2, 2, 3, 2, 2, 5, 5, 5, 5, 6, 5, 2, 5,
2, 2, 0, 6, 3, 6, 7, 2, 4, 5, 1, 3, 3, 5, 1, 7, 2, 0, 8, 4, 5, 8, 2, 3, 5

- Can we estimate λ using maximum likelihood estimation?

samples

Maximizing
the likelihood

The estimator
function $\hat{\lambda}$

Discussion and
summary

- Given results of experiment $\vec{k} = \langle k_1, k_2, \dots \rangle$
- Define the *likelihood function*

$$L(\lambda; \vec{k}) := \text{Prob}(\vec{X} = \vec{k}) = \prod_{j=1}^n p_{X_j}(k_j) = \prod_{j=1}^n e^{-\lambda} \frac{\lambda^{k_j}}{k_j!}$$

- Easier to maximize *log likelihood*

$$\ln L(\lambda; \vec{k}) = \sum_{j=1}^n [-\lambda + k_j \ln \lambda - \ln(k_j!)] = -n\lambda + n\bar{k} \ln \lambda - \sum_{j=1}^n \ln(k_j!)$$

where $\bar{k} := \frac{1}{n} \sum_{j=1}^n k_j$ is the *average* of the k_j .

Maximizing
the likelihood

The estimator
function $\hat{\lambda}$

Discussion and
summary

- Calculate the *log likelihood*

$$\ln L(\lambda; \vec{k}) = -n\lambda + n\bar{k} \ln \lambda - \sum_{j=1}^n \ln(k_j!)$$

- *Log likelihood* maximized for

$$0 = \frac{d}{d\lambda} \ln L(\lambda; \vec{k}) = -n + \frac{n\bar{k}}{\lambda}$$

- Result is $\lambda = \lambda_e$, where the *estimate* is given by

$$\lambda_e = \bar{k} = \frac{1}{n} \sum_{j=1}^n k_j$$

Maximizing
the likelihood

The estimator
function $\hat{\lambda}$

Discussion and
summary

- *Maximum likelihood estimator* for Poisson distribution is

$$\hat{\lambda}(\vec{k}) = \frac{1}{n} \sum_{j=1}^n k_j$$

- For the 50 points shown earlier, $\hat{\lambda}(\vec{k}) = 3.78$.
- Actual value of λ used to sample the points was 4.

3, 4, 3, 5, 3, 4, 5, 0, 5, 5, 5, 4, 2, 2, 3, 2, 2, 5, 5, 5, 5, 6, 5, 2, 5,
2, 2, 0, 6, 3, 6, 7, 2, 4, 5, 1, 3, 3, 5, 1, 7, 2, 0, 8, 4, 5, 8, 2, 3, 5

samples

Maximizing
the likelihood

The estimator
function $\hat{\lambda}$

Discussion and
summary

- So far, these results are not terribly surprising.
- The mean of the Bernoulli trials is p .
- The mean of the Poisson distribution is λ .
- Both MLE analyses estimate parameter by sample mean.

Maximizing
the likelihood

The estimator
function $\hat{\lambda}$

Discussion and
summary

- We have...
 - Reviewed properties of the *Poisson distribution*
 - Calculated *moments* $E(X^m)$ of the Poisson distribution
 - Defined *likelihood function* for the Poisson distribution
 - Maximized likelihood to find the *estimate* λ_e
 - Derived the *estimator* $\hat{\lambda}(\vec{k})$
